

3. Potential Outcomes

Announcements

1. Course website: stat158.berkeley.edu
2. 1st Lab this Weds.
3. 1st PS released tomorrow due next Friday
 - Covers material through this Friday.

A cheatsheet for the midterm and final exams!

I want to have review sessions before exams.

It will be great the due date of assignments 1500 Friday

More weight on projects.

Deadline on Sundays

- assignments due Sunday

@ 11:59 pm

↳ assigned Monday, due Sunday

I'd prefer Tuesday deadline
so we get the weekend +
1 more day to work on
stuff. Also a curve/bin
shift if the avg grade low.

office hours link doesn't work right now,
but more OH is always good.

Friday deadlines! ☺

Grade curve and Friday

11:59 pm deadlines. Final
weighting less.

More projects instead of quiz/exam.

eg. three projects in place of check-in
quiz, mid, and final.

I would want this class to
have 2-3 projects with a higher
overall weightage on the category
replacing the final exam and
keep everything else as is

Make it a project-based final
and project is individual, not
grouped.

no final, weight on projects

I would like more weight
on the projects as I feel it
captures more of our understanding
than exams where we may
perform less under pressure

I would prefer a second project that
could be done in place of the midterm, or
as a "mini final," with the final project in place
of the final exam.

The anchoring experiment yielded data on 73 students in this class. Say we conduct a hypothesis test that the difference in mean responses is zero. To which set of units will any conclusion apply?

The anchoring experiment yielded data on 73 students in this class. Say we conduct a hypothesis test that the difference in mean responses is zero. To which set of units will any conclusion apply?

- Ⓐ The 73 students we collected data on.
- Ⓑ The population from which these 73 students were drawn.
- Ⓒ All people.

Quantifying a Treatment Effect

def Causation

Notation:

def D_i :

def $\gamma_i(l), \gamma_i(0)$:

def τ_i :
